Relay knowledge handover

Dhanashree S. Hingnekar and Bhakti S. Kote

01 What works

A reviewer opens CampusConnect, adds project notes, verifies candidate statements against their source text and publishes an audience-specific handover. Neha receives the approved snapshot, a first-week plan and an acknowledgement action.

02 Architecture

The existing React and Vite screens call one Node API designed for Vercel. PostgreSQL stores source records, verified citations, decisions, immutable versions and activity. Signed anonymous links enforce workspace and role. Neon is the intended hosted database.

The default extractor uses English rules. Optional Gemini and Groq adapters request structured claims. The server verifies source IDs and exact excerpts, classifies uncertainty, and records the extractor. A reviewer decides what to include.

03 Verification status

All eight acceptance steps passed on the local production build with PostgreSQL. Seven core/database tests and two browser scenarios passed. GitHub reports a completed Vercel deployment. The team alias prompted for Vercel sign-in. Public workflow access, Neon connectivity and real provider calls remain unverified.

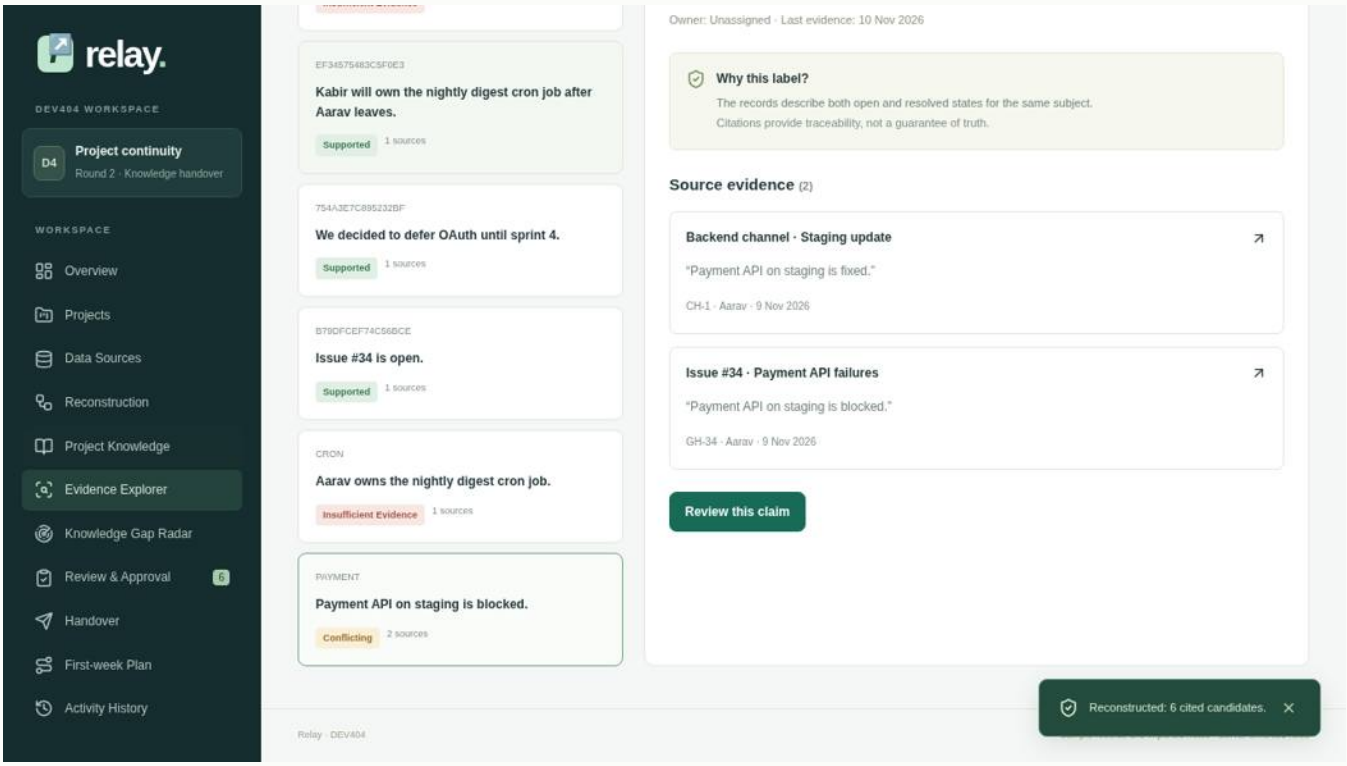

Open the public source repository

Open the Vercel operator dashboard

The final judge link should open the product while signed out. The operator dashboard above is for the team.

A handover a judge can trace

A judge imported the sentence "Kabir will own the nightly digest cron job after Aarav leaves." Reconstruction produced a Kabir ownership claim linked to that sentence.

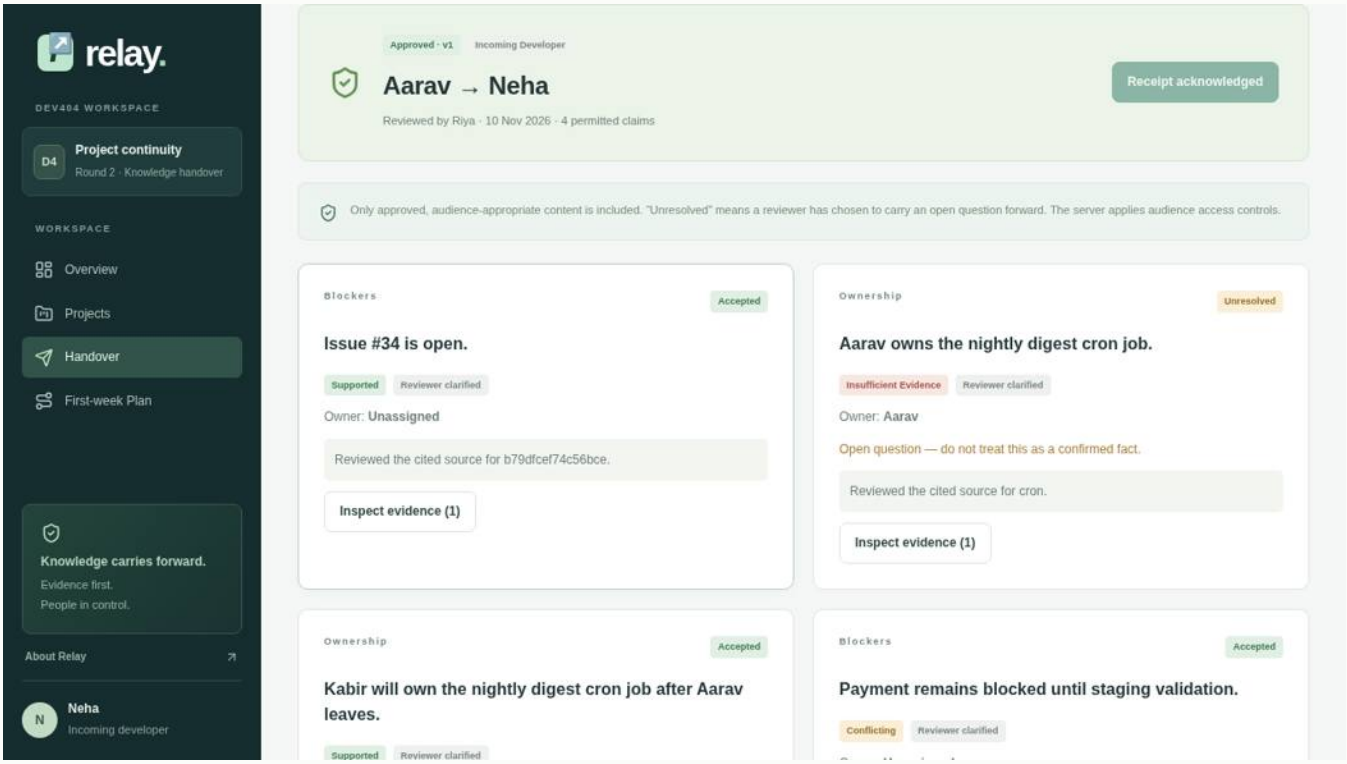

Evidence Explorer shows why the payment claim needs review. Issue #34 reports an open blocker; a chat message reports a fix.

The reviewer saved "Payment remains blocked until staging validation." The correction survived refresh. Version 1 included the accepted Kabir entry and the corrected payment statement. It excluded a rejected decision and the lead-only vendor record.

Neha opened a separate browser session, saved a task note, completed a task and acknowledged receipt. Direct API checks denied restricted, rejected and newly pending records. A later draft edit left the approved snapshot intact.

Delivery and next round

Receipt acknowledgement in the tested incoming-member view.

Changes since Round 1

One Vercel project replaces the proposed FastAPI and vector-search services. PostgreSQL replaces browser-only state. Anonymous links simplify judge access. Notes are imported; GitHub, board and chat examples are synthetic fixtures.

Known limits

Rules can miss paraphrases and contradictions. A quote establishes provenance; the reviewer checks meaning. Bearer links expire in seven days. Live external connectors and OAuth are outside this release.

Three Round 3 commitments

1. Re-review affected claims after a source changes and preserve earlier versions.
2. Route clarification questions to the departing member and capture answers.
3. Answer questions from permitted evidence and decline unsupported requests.
